

Sig Verify

List valid/revoked signatures; enqueue `verae.sig.verify`

Specialist: Crypto + JS.

Installation – Sig Verify

Requirements

- Peergos account on a Verae host
- Permissions: `STORE_APP_DATA`
- For outbox subjects: desktop-host connector running

Steps

1. Copy ``peergos-app.json`` and ``assets/`` into Drive (or use OrgTool / gallery).
2. Context menu on ``peergos-app.json`` → ****Install App****.
3. Open from Apps launcher.
4. Dark theme: Peergos passes ``?theme=dark-mode``.

Uninstall

Apps launcher → remove ``Sig Verify``. Data remains under ``/.apps/`` until deleted.

Developer reference – `verae-app-sig-verify`

Layout

```

```
peergos-app.json
assets/index.html
assets/sdk.js
src/peergos-sdk.mjs
src/lib.mjs
tests/lib.test.mjs
tests/certify-peergos.sh
```
```

Integration

Sandbox ``fetch`` → ``/peergos-api/v0/data``.

Outbox JSON → connector → NATS (``verae-nats-bus/schemas/subjects.json``).

Inbox JSON → app lists ``/inbox/``.

Tests

``make test`` runs Node unit tests against an in-memory ``fetch``.

``make certify`` adds Peergos compliance (manifest bounds, no NATS/WebSocket).

Function specs – sig-verify

Specialist: Crypto + JS.

listValid / listRevoked → JSON filenames

isRevoked(id, revokedFiles) → boolean

enqueueVerify(client, {object_sha256, signature_id})
Subject `verae.sig.verify`.
